A viscous liquid steadily exits a circular
vertical pipe (with inner diameter = D)

with a parabolic velocity distribution (see figure). After the fluid exits the tube, viscous forces smooth the velocity profile to a uniform value. This happens in a very short distance from the exit, so that gravity force is negligible.

In the study of partial differential equations, particularly in fluid dynamics, a self-similar solution is a form of solution which is similar to itself if the independent and dependent variables are appropriately scaled. Self-similar solutions appear whenever the

File Type PDF Fluid Dynamics Solutions

problem lacks a characteristic length or time scale. These include, for example, the Blasius boundary layer or the Sedov-Taylor shell.
