A guide to restoring and maintaining third-generation Corvettes offers comprehensive and photography-enhanced coverage of the full range of the C3's unique components, from engines and drivetrains to chassis and interiors. Original.

This book takes a look at fully automated, autonomous vehicles and discusses many open questions: How can autonomous vehicles be integrated into the current transportation system with diverse users and human drivers? Where do automated vehicles fall under current legal frameworks? What risks are associated with automation and how will society respond to these risks? How will the marketplace react to automated vehicles and what changes may be necessary for companies? Experts from Germany and the United States define key societal, engineering, and mobility issues related to the automation of vehicles. They discuss the decisions programmers of automated vehicles must make to enable vehicles to perceive their environment, interact with other road users, and choose actions that may have ethical consequences. The authors further identify expectations and concerns that will form the basis for individual and societal acceptance of autonomous driving. While the safety benefits of such vehicles are tremendous, the authors demonstrate that these benefits will only be achieved if vehicles have an appropriate safety concept at the heart of their design. Realizing the potential of automated vehicles to reorganize traffic and transform mobility of people and goods requires similar care in the design of vehicles and networks. By covering all of these topics, the book aims to provide a current, comprehensive, and scientifically sound treatment of the emerging field of "autonomous driving".

When American forces arrived in Vietnam, they found themselves embedded in historic village and frontier spaces already shaped by many past conflicts. American bases and bombing targets followed spatial and political logics influenced by the footprints of past wars in central Vietnam. The militarized landscapes here, like many in the world’s historic conflict zones, continue to shape post-war land-use politics. Footprints of War traces the long history of conflict-produced spaces in Vietnam, beginning with early modern wars and the French colonial invasion in 1885 and continuing through the collapse of the Saigon government in 1975. The result is a richly textured history of militarized landscapes that reveals the spatial logic of key battles such as the Tet Offensive. Drawing on extensive archival work and years of interviews and fieldwork in the hills and villages around the city of Hue to illuminate war’s footprints, David Biggs also integrates historical Geographic Information Systems (GIS) data, using aerial, high-altitude, and satellite imagery to render otherwise placeless sites into living, multidimensional spaces. This personal and multilayered approach yields an innovative history of the lasting traces of war in Vietnam and a model for understanding other militarized landscapes.
